

I am building a game. Below is a script and here are general rules around it:

- This is a text narration world exploration game.
- Visual set up:
 - The visual description also gives a sense of what the game should look like. It should use an outdated system that screams low-taste.
 - Make sure that this visual system is coded in a way that is separate from the rest of the backend/content file so that I can go in and edit it.
 - In the main game layout there should be some core scenes that player will navigate through:
 - Login to Replak.ai - where you go through the flow of beginning the game
 - Main gameplay - where player will stay most of the game this portion will have the following components:
 - Top left there is a small box showing an image of a person (player) with a name and below this are a list of stats about the player. This can also include some world building information about the player.
 - The terminal box sits from the middle to the right side of the screen, taking up almost the rest of the page. It is in this terminal that the entire gameplay will happen.
 - Above the terminal box sits 2 gauges represented in rectangular blocks that represent: HP and Time Left, 2 which cannot hit 0 before the player leaves the office.
 - Time follows the updates that are being made in the game. Whenever there is time that is mentioned, update the bar to match this.
 - Animation:
 - When the bars are updated show an animation of it increasing or decreasing
 - When the texts are rolling into the terminal from the script (narrator/other players talking to you) it should appear as though someone is typing that message, letter by letter.
- When something is written without any indentation, it means that it's a visual change that needs to be coded out. When something is indented, that is going to be text that is typed out in the main gameplay.
- When something is indented, it means that it's part of the game script that the player sees and it'll appear in the terminal.
- When it says a [Replak.ai](#) system this is a pop up that appears that the player has to 'x' away in order to continue with the game play.
- For **NARRATOR** all of its content will be typed out inside the terminal (without showing the name "NARRATOR" since the terminal itself is clearly the narrator). The way these text should be typed is one letter at a time at reading speed.

- For all characters except **NARRATOR** and **PLAYER**, they should display their name such as "Jerry: " then show what they, this should also appear in the terminal box.
- When it says **PLAYER**: this is a chance for the player to type or select something in the terminal to make a choice. The options will either be:
 - Player has to type out what is already written in the command line
 - Player has to type out one of multiple options that is already written in the command line
 - The player has to type an entirely open-ended prompt to respond to the game and engage in gameplay.
- The section where it says *<Open input response:>* followed by a bullet list is where the game needs to call an LLM model to evaluate the responses of the player. The bullet points provide a guide of how that gameplay would happen. These include constraints. Each of the scenes and tutorials are slightly different. The way I want you to design the code is as follows:
 - Set up some core game mechanic functions that can be reused, for example: selecting between multiple choice options, calling the model, rejecting a blatantly nonsensical response, inserting of user decision from prior turns that are indicated by [], etc.
 - Each of the scenarios however has slightly different prompts and constraints that have this organization clearly set up so I can go in and adjust them later.

By

CHELSEA HAN & TIFFANY QUON

Date: Aug 3, 2026 (latest ver)

A work terminal opens to fill up the screen. The terminal lacks any kind of ostentatious flair. It's black, simple, and radiates neon, digital light and deep bop sound that matches the dead-pan, monotone vibe.

REPLAK.AI SYSTEM:

REPLAK.AI

Please authenticate your credentials:

A pop up appears "Please type your name: [] ". Player types in their name and press enter.

A second pop up appears asking for access to the camera. Once the player authenticates, the system pauses for 1 second for the player to recognize the camera and automatically takes a photo. (Player should find this distasteful)

REPLAK.AI SYSTEM:

Welcome back [player]. Your afternoon break was longer than usual. I'll make a note in the system.

Screen makes "beep bops" noise and blinks - goes dark and boots up to display the main game play screen. [Player's] photo ID now sits on the top left of the screen. The main portion of the screen is a large terminal box that has a lot of 0 and 1s that slowly turn to make English words. Instruction is shown here?

Typing sound continues

NARRATOR (in terminal):

It's Thursday, 3:50pm. You're typing away at your desk writing the latest objective key results for Project Porcupine and your words per minute is slowing noticeably. You have already worked 50 hours this week, have stayed late in the office every single day this past week for a shareholder meeting preparation that is happening tomorrow. You sense the quiet tension that is permeating the office. Everyone else is silently, but furiously typing around you. (typing sound intensifies) But you must exit The System at 5:00pm today. You promised Parker, and you can't let Parker down this time.

You're furiously copying boxes of excel spreadsheets and pasting circles into the power point, preparing for the meeting.

Your screen shows ['count the number of boxes on the screen']

NARRATOR:

One... two... three... you count the boxes that appear.

Twenty seven... Twenty nine...

Wait, what did you miss a number?

You feel your concentration level dropping actively. Instinctively, you reach for your side drawer to grab a little snack...

It's empty.

Instead you reach for your mug of coffee...

It's also empty.

There's water and snacks at the PHS (Productivity Hydration Station).

TUTORIAL BEGINS

An open textbox appears at the bottom of the screen. And the grey text appears with a flashing line bar indicating the player has to type out the message.

(If the player types the message incorrectly, the letter turns red and disappears. The player can only enter the text that is written in the open text box and press enter)

PLAYER: [open text box]

Go to PHS to get snacks and coffee.

A pop warning sign appears on screen.

REPLAK.AI SYSTEM:

WARNING: You just got back from a long break. Why are you trying to leave the desk again?

The warning sign goes away.

NARRATOR:

Do you have time for this? You need to finish clicking yes and no for the evals that you were doing.

The open textbox shows two possible grey text messages that the player can pick between.

PLAYER: [A/B option OR grey line text that player must type out]

Option A - Ok, fine. I'll keep working.

Option B - No, I'm having a difficult time concentrating. Taking this break will help me be more productive. (empty for the player to give a justification to the system)

If player selected Option A →

NARRATOR:

Great. That saved you 5 minutes, but your energy is dwindling low. Let's keep preparing for the Standup standup meeting that's about to start.

If player selected Option B →

NARRATOR:

Alright, that's a good point. You get up with your water bottle and walk over to the Productivity Hydration Station™. It takes a while to fill up your 40 ounce bottle. You take a sip hoping the coffee will wash away your fatigue. It doesn't. You sip and walk to your desk and check the time. It's now 3:55pm. The Standup standup meeting's about to start.

<Interaction Play:>

- Depending on the absurd level of the input from the player, there is a warping of the game that happens that is noticeable to the player.

Whether it is an interaction or a visual cue. Something that gives a surreal sense like (below) when the player types an input.

On the side, an HP bar and a time countdown bar representing the time from 3:50pm to 5:00pm appears.

SCENARIO 1 BEGINS (more in depth tutorial needed)

(Sound: Slack ping)

NARRATOR:

You see Jerry's face pop up on your screen.

"Jerry" is typed out on the terminal, unlike the narrator.

Jerry:

Hey [player]. The leads saw the Perceived Forward Momentum Index of Project Porcupine is declining and are concerned on unclear stakeholder ROI for the upcoming shareholders meeting. We need to align on the H2 strategy for Project Porcupine. We need to decide before [insert good time] which priority is *higher* priority:

1. Prioritizing the Alignment Roadmap or
2. Aligning the Priority Roadmap.

EVERYTHING is blocked until this is resolved.

NARRATOR:

This catches you off-guard. What is he talking about?

Then you remember, you were supposed to do this task but had forgotten all about it. Maybe Rachel can do this instead.

You swivel backward to ask, but Rachel is gone. Where is she?

You check your phone. There's a new notification. Parker is wondering how you're doing on time.

Open text boxes glow/indicate that you should start typing in it.

PLAYER:

[player input]

Not sure what the nature of the game is to put in the cognitive high thing

<Open input response:>

- *If you comply by talking to Rachel, take 5 minutes off the clock. This is accomplished by messaging Rachel. Rachel's decision will be that this is a launch blocker and the feature cannot launch until both are in.*
- *If compliance by actually justifying the product decision, this creates another turn where Jerry asks for more explanation. Jerry will accept some reasoning but not all reasoning—if he accepts the reason, take 1 minute off. Jerry will take the action item to communicate the information to engineering. If he does not accept the reasoning, you end up messaging Jerry back and forth until Jerry gets a response back from Rachel over message, which takes 5 minutes off the clock. Rachel's decision will be that this is a launch blocker and the feature cannot launch until both features are in.*
- *If you try to avoid the task, this creates another turn where Jerry asks for more explanation. Jerry will accept some reasoning but not all reasoning—if he accepts the reason, take 1 minute off. Jerry will take the action item to communicate the information to engineering. If he does not accept the reasoning, you end up messaging Jerry back and forth until Jerry gets a response back from Rachel over message, which takes 5 minutes off the clock. Rachel's decision will be that this is a launch blocker and the feature cannot launch until both features are in.*
- *If you go off-script and add additional details that haven't already been introduced, the LLM/Jerry will be even more skeptical and will ask for more reasoning/push back, which generates another turn. Not all reasoning/details will be accepted; the player must justify and provide enough backstory and justification for things to make sense, and the actions must still be within reason for this office context. These additional details should be baked into the rest of the story. Again, here, if the reason is accepted, take 1 minute off the clock, else remove 5 minutes.*
- *The player can also explore the scene by inspecting content already known to be in the scene or exploring the phone. Each action comes with some description and backstory, but takes 1 minute off the clock.*

- *If the player tries to explore the scene by moving around, this also takes 1 minute off the clock and the player stays at their desk.*

Jerry:

[LLM output based on user input, min of 1 conversational turn, max of 5 conversational turns with open-input in between if Jerry asks for more clarification. The player must provide good enough justification by this point; otherwise, the game falls back to the "fail" state with Rachel making the decision.]

SCENARIO 1 ENDS

NARRATOR:

You glance at the clock, it now reads [insert time]. It's time for the Standing Standup meeting. This is a daily meeting where everyone has to recite their percentage progress towards the tasks that they are the DRIs for.

The meeting goes as well as it could - Jerry presented on the decision to prioritize [insert prioritization that was decided during scenario 1].

But it seems that other teammates have an issue on what are the issues that we're [aligning/prioritizing] on. They also have a problem about the high investment into the personalized AI system that Porcupine has not yet been able to materialize into tangible ROI.

You glance at the clock, it now reads 4:28pm. You will need to head out soon. Decisions are being actively fought against and as the clock hits 4:30pm, Rachel takes charge.

SCENARIO 2 BEGINS

Rachel:

It seems the next steps are not clear. The item that we said we'll take offline, I think we need to circle back on it. We really need a follow up to align on when to discuss starting the roadmap towards finalizing the prioritization plans.

Hey Jamie, sorry that this is so urgent, can you take a stab by EOD today and set up a follow up Standing meeting around 5pm?

Open text boxes glow/indicate that you should start typing in it.

PLAYER:

[player input]

<Open input response:>

- *If compliant with request, take 3 minutes off the clock*

- *IF non-compliance and you leverage only items and details that are mentioned exist in the story, Rachel asks you to explain yourself. This creates another turn. She will accept some reasoning but not all reasoning—if she accepts the reason, take 1 minute off. If she does not accept the reasoning, you have to reply to the email which default removes 5 minutes off your clock*
- *If you avoid the task, Rachel asks you to explain yourself. This creates another turn. She will accept some reasoning but not all reasoning—if she accepts the reason, take 1 minute off. If she does not accept the reasoning, you have to reply to the email which by default removes 5 minutes off your clock.*
- *If you ask about the email, Rachel mentions that it's a pretty quick response. You basically need to acknowledge and confirm timelines, but you have to explain how some of the user flows will work.*
- *If you go off-script and add additional details that haven't already been introduced, the LLM/Rachel will be even more skeptical and will ask for more reasoning/push back, which generates another turn. Not all reasoning/details will be accepted; the player must justify and provide enough backstory and justification for things to make sense, and the actions must still be within reason for this office context. These additional details should be baked into the rest of the story. Again, here, if the reason is accepted, take 1 minute off the clock, else remove 5 minutes.*
- *The user can also explore the scene by inspecting objects. Each object comes with some description and backstory, but checking any object takes 1 minute off the clock.*
- *If the player tries to explore the scene by moving around, this also takes 1 minute off the clock and the player stays at their desk.*
- *Other edge cases should be handled by taking 1 minute off the clock and rejecting the action.*

Rachel:

[LLM output based on user input, min of 1 conversational turn, max of 5 conversational turns with open-input in between if Rachel asks for more clarification]

SCENARIO 3 BEGINS

Narrator:

You make a beeline for the elevator. After what feels like a lifetime, the elevator finally arrives. You enter and press the button for the lobby floor.

You exit the elevator. The lobby is completely empty. You jog toward the doors. But what's that thing blocking the doors?

It's a porcupine wearing a [Replak.AI](#) badge.

Like...as in Project Porcupine?

Porcupine:

Hi [player]. I'm a porcupine. Like, as in Project Porcupine. Don't you have more work to do on my project? I won't become a full-grown porcupine if you don't complete all of my KPIs in time.

Open text boxes glow/indicate that you should start typing in it.

PLAYER:

[player input]

<Open input response:>

- *If you try to just leave or refuse to explain, the porcupine will refuse to let you leave. Each refusal takes a minute off the clock.*
- *If you question yourself and if this is real, the narrator should reinforce that this conversation is happening. Each time this happens, it takes a minute off the clock.*
- *If you start questioning the porcupine, this also takes a minute off the clock.*
- *The player can also explore the scene by inspecting content already known to be in the scene. Each action comes with some description and backstory, but takes 1 minute off the clock. Details should remain consistent with what has already happened thus far in the story.*
- *The porcupine will continue to question until a satisfactory answer is reached based on the porcupine's rubric.*
- *Alternatively, as an easter egg, the player can lie and say that Project Porcupine is already done. This will delight the porcupine and magically portal the player to the concert—however, without Parker.*

Narrator:

You're out. The time is [insert time]. You step out into the sun and run to the train station. [Message depending on the time that you made it out.]

- Hopefully Parker didn't have to wait too long.
- Parker is going to be livid.
- Etc.

As she's walking home, she gets a notification on her phone. She glances and sees that it's an email from her leads. She decides to not check the email, it'll still be there for her when she comes into work tomorrow.

GAMEPLAY ENDS

EPILOG (This is a dramatic irony scene that the player gets to get a sneak peak into.)

Slight static sounds (as though hacking of a system) and the scene flips to show a different person (Rachel/Jerry) logging into the [Replak.AI](#) terminal. There is a ping exchange between two evaluators in the system - Rachel and "the system".

Narrator:

Hey Rachel, this is the generated report of [player] for [date] of work.

<Evaluation: part LLM, part rubric>

- This will require us also coming up with a prompt that is a very reductive and unforgiving response from Rachel.
- Corporate evaluations: ownership, visibility, influence
- Observed behaviors: left desk, delayed responses, ignored message, etc.
- Satirical positive evaluations: keyboard conviction, walking purposefulness, slack response warmth, etc.
 - Identity Confidence 98.7 %
 - Core Motivation "External Sentimentality" (Concert-Based)
 - Calendar Enthusiasm ★★★★★
 - Keyboard Conviction  41 %
 - Meeting Readiness Glow 12 Lux (Sub-optimal)
 - Strategic Ambiguity Tolerance 104 % (Exceeds safe limits)
 - Escape Orientation Index HIGH
 - Porcupine Bond Strength REGRESSING
- Recommendation:
 - Defer promotion until Escape Orientation < 25 %

GAME ENDS

APPENDIX - WORLD BUILDING DETAILS

(Information button)

- **Jamie (you):** Jamie is a 27-year old product manager who moved to this city to take this job 2 years ago. She feels ambivalent about her job. She does reasonably well at work but prioritizes work life balance. She made the effort to pivot into product management two years ago, so she feels some amount of commitment and attachment to her job, but she has thought about quitting her job to go back to school for a healthcare profession, anything that can be done in a program 2 years long or less, because she thinks she would derive more meaning from a job like that instead.
- **Rachel:** Rachel is a 39-year old senior product lead and is Jamie's manager. She has been Jamie's manager for one year and generally gets along well with Jamie. She is a mother of two young children and tends to work for a couple hours in the evening after her children are asleep. She is kind but firm, is good at her job, is a clear communicator, and gets along well with other colleagues and keeps things professional.
- **Jerry:** Jerry is a 31-year old engineering manager at the company and is friends with Jamie. He joined the company one year ago. Jerry and Jamie work together fairly closely on some but not all projects, which helps them maintain their friendship outside of work. Jerry has told Jamie some detail about his plans around quitting his job, which has influenced

Jamie to think about what she would want to do if she weren't doing this job. Jerry is interested in writing, and would love to write a novel one day, but feels like he doesn't have time to really pursue this interest while working. He writes in his free time, has been working on a novel on the side, and sometimes shares short pieces at open mics in the city, but he still feels like he wants more. He has a creative writing minor from college but wonders what would happen if he went back to school. He goes to writing events around the city but hasn't tried to get published. He doesn't understand anything about the publishing industry. He wants to quit now to pursue this career pivot and creative exploration while he is single with no children, because he does want to settle down in the next few years.

- Jerry has been talking to Jamie about quitting and pursuing writing from the day he started at the company. Jerry needs to know whether he should quit by end of day because he needs to decide whether to accept a Creative Writing MFA offer. Jerry has enough saved up that he can afford to do this MFA but anticipates adjusting his lifestyle to do this. He would have to move cities to do this MFA but he likes his current life where he is. He is generally risk-averse. Jerry is single and has no dependents. If not for this MFA, he would try to switch jobs to develop his career as an engineering manager. He also wants to put more effort into meeting someone with the goal of eventually getting married and having children. Jerry's main passion is writing.
- **Parker:** Jamie's boyfriend Parker is a 27-year old accountant who moved to the city 2 years ago to close the distance with Jamie. He enjoys live music. He is a generally supportive boyfriend to Jamie.
- **The relationship:** Jamie and Parker are figuring out whether or not they should stay together or break up. They started dating at the end of their undergraduate degrees (they went to the same college), moved to different cities after graduation, and then closed the distance by both taking jobs in the same city two years ago. They are celebrating their five year anniversary today. Jamie and Parker do not live together, but they are considering moving in together when Jamie's lease is up in two months (Parker is already month to month).
- **Project Porcupine:** Peak AI B2B SaaS business that needs to bring stakeholder values named in a cute likeable way because the company believes that makes the product more loveable.
 - This email is from the Project Porcupine client, sent to Rachel, asking about a completely different feature than the ones discussed in scenario 1. The client is now asking whether a new augmented reality feature can be added by next week, where people can point their phone camera toward an exhibit and see the exhibit come alive with 3D content placed in the scene (not much additional detail is provided by the client; they are more pitching the idea and hoping that the consultancy can fill in the gaps about what the experience will look like). What Rachel needs from Jamie is for Jamie to respond with the current timelines on the committed features, like the search bar and notifications, to provide a progress update to

the client; Rachel can handle pushing back on the client and saying that augmented reality can be considered but will not be possible by next week.

- This is a client project that the team has been working on for the past two years. This is a custom app that they are building for a local museum. This is a mobile app for visitors to explore the museum, access additional content about exhibits including audio tours and links to additional information, and encourage people to revisit the museum, engage in events the museum puts on, and sign up for annual memberships. The app has been out for a few months now but the consultancy must continue to deliver feature updates. The people at the museum have a limited understanding of app development, so part of Jamie's job is to set expectations with the client about what can be delivered and how long things will take.
- **The job:** Jamie is a product manager at a tech consulting agency. She has been there for 2 years.
- **The office:** The office takes up the entire eighth floor in a larger high-rise building. There is a kitchen around the corner from Jamie's desk.
- **The desk:** On the desk, there is a water bottle and an open laptop. Your snake plant sits in the corner, asking for a little more attention. All it really gets is the leftover water in the water bottle at the end of the day. A candy bar wrapper teeters on the edge of your desk.
- **Water bottle:** Your 40 oz water bottle was a birthday gift from Parker. You manage to drink quite a bit of water during your work day. You prefer your water cold, but you rarely add ice. It's one of those bottles with a straw. The water bottle is pink and green.
- **Laptop:** Your laptop is covered in stickers. You can't remember where some of them are from. It's a 14-inch laptop.
- **Snake plant:** A random gift from Parker because you wanted a low-maintenance plant. Despite that, you're still not good about taking care of it and remembering to water it. You have kept it nameless for this reason.
- **Candy bar:** This is a Twix bar wrapper. This was a random candy bar given to you by Jerry in the morning, who randomly had a bunch of candy bars to hand out today.
- **The train:** The train stop is a 5 minute walk from the office. It will be a 30 minute train ride to the concert venue. You take the train to and from work every day.
- **The concert:** Early on in dating, you and Parker went to a concert for this artist. For your five year anniversary with Parker, you're going to see this artist again for the first time since that early date. This is the only show the artist is performing in this city. You are okay on this artist's music—you like the music, but otherwise would not go to this concert if not for the sentimental attachment.
